Arcesium Hiring Team
New York, NY

Subject: Lead Infrastructure Engineer – Distributed Systems Application

Dear Arcesium Hiring Team,

For over two decades, my career has been defined by building and owning the mission-critical, distributed infrastructure that underpins global financial and technology institutions. The description of your Lead Infrastructure Engineer role—requiring a polyglot engineer to own the ecosystem powering a SaaS API-driven business—is not just a job description; it is a precise summary of my professional focus. I am particularly drawn to Arcesium’s mission of solving complex data-driven challenges for sophisticated financial clients, a space where my unique blend of deep technical architecture and financial sector experience is directly applicable.

Your requirement for a professional who demonstrates ownership of critical systems is the central theme of my resume. As a Director of Cloud Architecture at Biophy, I am currently the sole architect and builder of a green-field AWS infrastructure, taking full ownership from design through implementation. This includes developing a custom AWS CloudWatch alerting system with Lambda, SQS, and SNS to ensure the reliability of our AI-powered RAG platform. At McKinsey & Company, I owned the end-to-end migration of complex mainframe EDA systems to a modern AWS serverless architecture, constructing innovative solutions with EventBridge, Lambda, Step Functions, and EKS to provide a highly available foundation for internal applications.

My technical expertise aligns exactly with the core competencies you are seeking:

- **Distributed Systems & Polyglot Development:** I architected the cross-cloud cost analytics platform at Yotyscale, building microservices in Java/Kotlin/SpringBoot and orchestrating them on EKS/AKS with Istio. I led the development of genAI systems with RAG and multi-agents at McKinsey using Python, FastAPI, and Pydantic, and I regularly develop in Typescript/Node.js, Bash, and Ruby.
- **Core Infrastructure & Networking:** My experience is foundational. I have designed Linux HA clusters with Pacemaker/Corosync, implemented secure SSO using LDAP and Kerberos KDC with cross-realm authentication to Active Directory, and configured enterprise-grade load balancers (F5 Big-IP, ALBs, nginx, HAProxy). At Barclays, I established the group-wide technology strategy for message transports (Kafka, IBM MQ) and event-driven architectures.

- **AWS & Infrastructure as Code:** I have deep, hands-on expertise in running critical workloads on AWS, which I codify through mastery of Terraform/Terragrunt. I have designed and deployed hundreds of modules to dynamically manage everything from EKS clusters and IAM roles to S3 buckets, R53 records, and SFTP servers, ensuring security and reproducibility.
- **Constructing Innovative Tools:** I have a proven record of crafting solutions to streamline operations. I developed the “AutoBuild” system at Comcast to automate the build/release process for 200+ microservices and built performance monitoring systems integrating Graphite, JMX, and Splunk.

The opportunity to apply this experience to the specific complex challenges faced by Arce-sium’s clients is incredibly compelling. I am not just looking for a job; I am seeking a platform where my ownership mentality, architectural rigor, and passion for building resilient systems can have a direct impact on your business outcomes.

My resume is attached for your detailed review. I am very eager to discuss how I can contribute to your team.

Sincerely,
Yongjun Rong
