Hiring Manager

Vice President of Engineering Search

Litmus Automation

Santa Clara, CA

Subject: Application for Vice President of Engineering Position

Dear Hiring Manager,

I am writing to express my profound interest in the Vice President of Engineering position at Litmus Automation, as advertised. With a career defined by hands-on technical leadership, architecting complex distributed systems, and scaling global engineering teams, I am excited by the opportunity to lead your world-class engineering organization and power the future of smart manufacturing with your Industrial Edge Data Platform.

Your description seeks a proven technical leader who is a “master architect” and a “technical force multiplier.” My experience aligns directly with this need. As a hands-on Director of Cloud Architecture, I designed and implemented comprehensive Infrastructure as Code (IaC) for AWS, importing and redesigning resources according to AWS best practices. Furthermore, as VP, Lead Architect Engineer at Barclays, I directed the group-wide technology strategy for distributed systems, microservices, and event-driven architecture. I established architecture handbooks, drove the technology transformation from on-premises to public cloud, and led working groups to make critical technology investment decisions. I have consistently been the leader who “rolls up their sleeves,” from pioneering Docker Swarm CI/CD environments at Oracle to developing custom monitoring systems with Lambda and SQS.

The role requires an expert in scaling complex, scalable enterprise software involving Edge Computing, Cloud-Native technologies, and IoT. My background is a testament to this. I have architected and led the implementation of platforms supporting AWS, Azure, and GCP at Yotascale, built high-availability SOA environments on AWS EC2/S3 at Boomi, and managed the SDLC for over 200 microservice projects at Comcast. I have deep, practical experience with the technologies in your stack, including Kubernetes (EKS/AKS), Terraform/Terragrunt, Java, Python, Kafka, PostgreSQL, and implementing rigorous CI/CD and observability practices across all my roles.

You are looking for a leader who has shipped AI/ML features and can spearhead your AI initiatives. At McKinsey & Company, I led the development of genAI systems with RAG and multi-agents to accelerate mainframe migration and built comprehensive genAI solutions to speed up data pipeline development on PySpark and Databricks. I have hands-on experience with vector stores like ChromaDB and Milvus, prompt

tuning, and architecting data ingestion systems for AI-powered platforms.

Finally, the position demands a global leader who can manage, scale, and unify high-performing, geographically distributed teams. I have extensive experience leading and mentoring international teams, from establishing development standards and mentoring junior engineers at Comcast to leading technology working groups at Barclays. I foster a culture of accountability, innovation, and continuous improvement, which aligns perfectly with the values you seek.

I am deeply impressed by Litmus Automation's mission to bridge OT and IT and transform the industrial world with data. My unique blend of strategic vision, deep technical expertise in cloud, edge, and AI, and a proven track record of scaling engineering operations would allow me to immediately contribute to your ambitious goals.

Thank you for your time and consideration. I have attached my resume and look forward to discussing how I can help scale Litmus Automation's technology and team.

Sincerely,
Yongjun Rong
