Hiring Manager
Posit

Dear Hiring Manager,

I am excited to apply for the Principal Software Engineer position at Posit, where my passion for building high-performance, scalable systems and my extensive experience in cloud architecture, performance optimization, and developer tools align perfectly with your mission to empower data scientists and researchers worldwide. With over 20 years of experience designing and delivering distributed systems, microservices, and automation frameworks across industries like finance, consulting, and technology, I am eager to lead the development of Posit's open-source benchmarking tool and foster a performance-first engineering culture.

In my current role as Director of Cloud Architecture at Biophy, I designed and implemented a modular Infrastructure as Code (IaC) framework using Terraform, aligning AWS resources with best practices to support an AI-powered RAG platform. I also architected a custom AWS CloudWatch alerting system with Lambda, SQS, and SNS, delivering comprehensive performance monitoring and dashboards that reduced mean time to detection (MTTD) and resolution (MTTR). At McKinsey & Company, as a Senior Cloud Engineer, I led the development of genAI systems with RAG and multi-agent orchestration, optimizing data pipelines on PySpark and Databricks for complex transformations. These experiences honed my ability to translate complex performance metrics into actionable insights, a skill I will bring to Posit to establish performance baselines and build intuitive dashboards.

My deep expertise in Linux systems, Kubernetes (EKS/AKS), and cloud-native architectures (AWS, Azure, GCP) equips me to tackle the challenges of performance analysis and scalability engineering. For instance, at Yotascale, I architected a cross-cloud cost analytics platform, leveraging Kubernetes and Istio to ensure scalability and observability for microservices. My proficiency in Python, Java, and TypeScript, combined with enthusiasm for exploring new languages like Go or Rust, positions me to adapt to Posit's ecosystem and drive innovation in benchmarking tools. Additionally, my curiosity about AI technologies, demonstrated by my work with openAI APIs and LangChain, aligns with Posit's interest in leveraging LLMs for development.

As a mentor and leader, I have a proven track record of cultivating high-

performing teams. At Biophy, I mentored engineers on AWS best practices and Clean Architecture, while at McKinsey, I drove adoption of genAI and RAG, elevating team proficiency. My ability to communicate complex technical concepts clearly and empathetically will help me champion a performance-first mindset at Posit, empowering both internal teams and customers to optimize their workflows.

I am inspired by Posit's commitment to open-source innovation and its mission as a Public Benefit Corporation to advance science and education. My experience building reusable tools, such as the open-source JSON resume framework on GitHub, reflects my alignment with Posit's values of community-driven development. I am eager to contribute my technical expertise, leadership, and user-focused approach to enhance Posit's product suite and deliver impactful solutions for scientists globally.

Thank you for considering my application. I would welcome the opportunity to discuss how my skills and experiences can contribute to Posit's performance strategy. Please feel free to contact me at 856-408-4027 or rongyj@hotmail.com to schedule a
